ABSTRACT

With the evolution of new sophisticated technology, military manpower planning problems involving specialized training have become increasingly important. This problem has become especially urgent for the airborne community of the U.S. Army because this community has a variety of special training requirements which make the problem especially complex when other dimensions such as grade level and military occupation specialty are also taken into account. This thesis formulates a methodology which applies Markov chain theory to forecast future inventories and uses marginal analysis to determine the optimal numbers of soldiers with certain skill levels and job types who should enter special training. The goal of the optimization model is the minimization of the maximum percentage shortage of personnel relative to authorization. The methodology is used with FY 1984 data to determine the optimal numbers of soldiers to enter special training during fiscal years 1984 and 1985 to minimize the maximum percent shortage.

I. INTRODUCTION

In the last two decades, with the evolution of new sophisticated technology, military manpower planning problems invclving specialized training have become increasingly important. Critical questions of how many people to train and hcw to train them have to be answered by the military in crder to optimize the effectiveness of their forces. This problem has become especially urgent for the airborne community cf the United States Army. This community has a variety cf special training requirements which make the prcblem especially complex when other dimensions such as grade level and military occupation specialty are also taken into account.

In an earlier thesis Captain Donald B. Chung formulated the manpcwer planning problem of a section of the airborne community and solved it by dynamic programming. That fcrmulation minimized the sum of the squares of the shortages for all duty positions ccnsidered [Ref. 1]. In this thesis the airborne community as a whole is considered, a different cbjective function is formulated, and slightly different constraints are used.

The remainder of this chapter will provide some basic information about the airborne community whose perscnnel planning is the subject of this thesis. More detailed information about the airborne community can be found in [Ref. 2].

Chapter 2 discusses formulation of the model. It presents a mcdel which will forecast personnel requirements for each type of special training and project those requirements into future years by utilizing Markov Chain theory. Additionally it will examine the application of marginal

analysis as a viable optimization strategy in determining an optimal training policy in the airborne community.

Chapter 3 discusses the execution of the model. Chapter 4 demonstrates the potential of the model as a decision making tool and as a manpower planning model.

A. THE AIRBORNE COMMUNITY

1. Grade and Skill Levels

A soldier in the United States Army is recruited for two, four or six years (and may renew the recruitment repeatedly for two, four or six years). During the period of enlistment a soldier may be promoted through various grade levels. Initially a soldier enters the service at grade level one. In order for an individual to be promoted from one grade level to the next grade level, he must stay in the grade a specific period of time and be selected by a centralized selection board.

The nine enlisted grade levels as correlated with rank are listed in Table 1 .

TABLE 1

Grade Levels as Correlated with Ranks and Skill Levels

GRADE	RANK	SKILL LEVEL
E-1	Private	1
E-2	Private	1
E-3	Private First Class	1
E-4	Specialist	1
E-5	Sergeant	2
E-6	Staff Sergeant	3
E-7	Sergeant First Class	4
E-8	Master Sergeant	5
E-9	Sergeant Major	5

Additionally, a soldier in the U.S. Army has a skill level (SI) identifier which is an indicator of his technical and tactical experience. These skill levels are closely related to the grade levels. The relationship between skill and grade levels is also listed in Table 1 .

The skill level identifier used is a two-digit code with the first being the skill level, and the second digit being a zero.

2. Military Occupation Specialty (MOS)

After the completion of basic training and advanced individual training each soldier in the U.S. Army is awarded a Military Occupation Specialty (MOS). There are 365 MOS's for which a soldier may be trained. The MOS designation used is a two digit number followed by a letter (e.g. cook (94B), infantryman (11B)). Combining MOS's with all possible skill levels that a soldier can have in that particular MOS creates a total of about 1200 MOS/SL combinations.

3. Career Management Field (CMF)

A soldier has a career pattern to follow. This pattern consists of a network of jobs specified by MOS and SL. Each MOS is included in only one CMF. There are thirty one Career Management Fields (CMF's) in the United States Army. As an example, the career progression for CMF 16 is diagrammed in Figure 1.1 . This diagram shows, for example, that a Hawk missile crew-member of skill level one (16D10) advances through 16D20, 16D30, 16D40 then to 16Z50 and finally to C0Z50. All the career progression patterns, as they appear in [Ref. 3], are shown in Appendix A.

4. Skill Qualification Identifier (SQI)

After the award of the MOS, a soldier can undergo special training which, in case of successful completion,

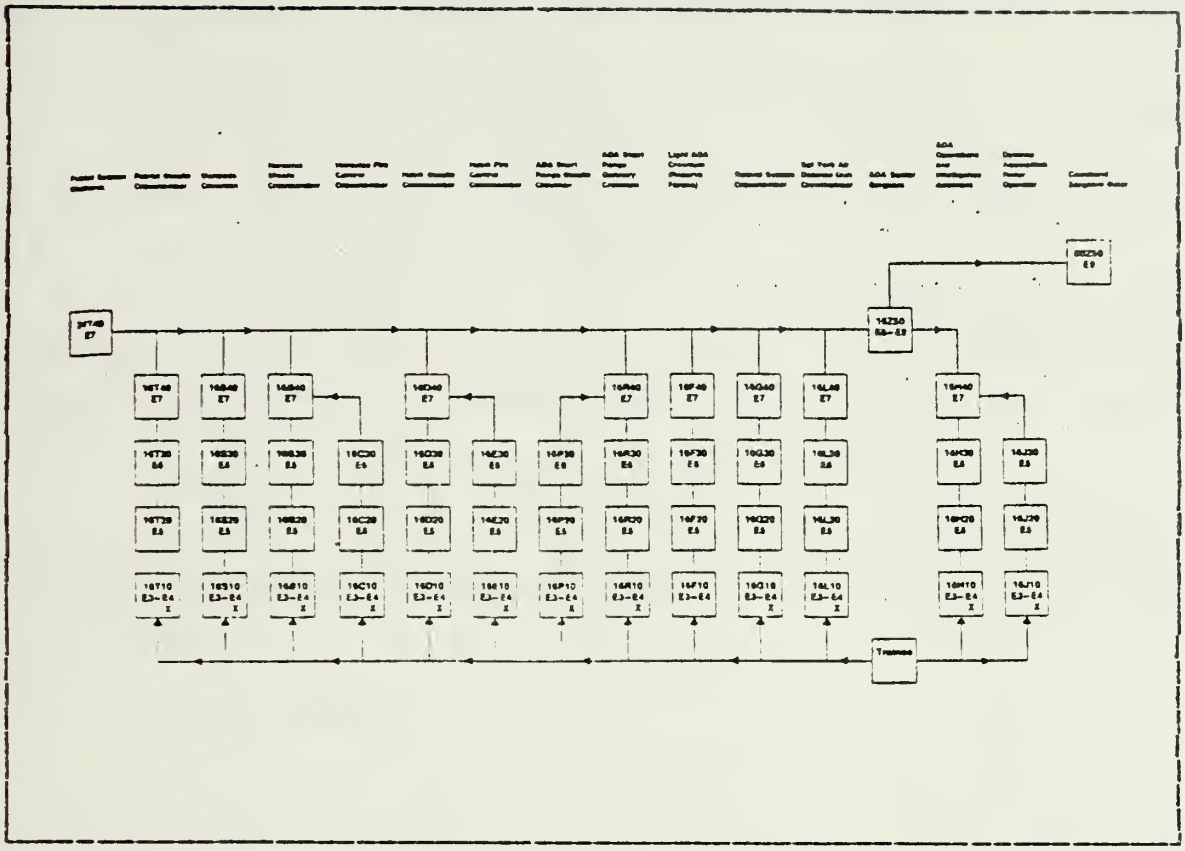

Figure 1.1 Career Progression Pattern for CMF 16

will award a Skill Qualification Identifier (SQI). There are twenty nine SQI's within the United States Army. Only those relevant for the airborne community will be considered in this thesis. For example, a cook of skill level 1 who successfully completes ranger training is awarded the SQI of 'V' for ranger, and his complete job type, grade level, and job skill then will be 94B10V.

There are four types of special training within the airborne community:

a) Airborne training. Each graduate of this training is awarded the skill qualification of P for parachutist.

b) Ranger training. Each graduate is awarded the SQI of V for ranger.

c) Special forces training. Each graduate is awarded the SQI of S for specialist.

d) Pathfinder, not considered in this thesis due to the small number of soldiers .

Recruitment for P, or V training takes place among soldiers of all MOS's and skill levels, but the recruitment largely consists of soldiers with MOS 11B and SL's 1 and 2 for P, or with MOS 11E and SL's 2 and 3 for V.

During FY84 a new CMF (CMF 18) was created to include all special forces personnel, and SQI S was discontinued. Personnel possessing SQI S at that time were given the opportunity to convert to CMF18.

5. Duty Position

In the US Army each soldier is qualified for a special type of job and that is indicated by his MOS, SL, and SQI. For example a soldier with skill level 1, MOS 13B-Cannon Crewman, and SQI P, is qualified for duty position 13B10P. There are about nine hundred fifty duty positions in the airborne community.

6. Manpower Requirements

The levels of authorization by year for the airborne community are given by the personnel structure and composition system (PERSACS) document and for the purpose of this thesis are assumed to be known. When it is necessary to work with future predictions and there are no available tables of authorizations, the current authorizations will be assumed to remain constant. The PERSACS document gives the authorizations for each duty position (as it is specified by MOS, SL, and SQI) and reflects levels annually determined based upon current military size, mission, and budget constraints.

Depending on the mission of the unit the authorization may be above or below the strengths shown by the table of Organization and Equipment (TOE) documents.

In order to support the assignment policy of rotation in and out of the airborne community the manpower pool factor was created. This is the surplus for each duty position that ought to exist outside the airborne community in order to fill vacancies created upon the departure of soldiers from the airborne community, and to provide soldiers with SQI P, V, or S an opportunity to serve in duty positions outside the airborne community. The authorizations including the pool factor for each duty position can be obtained by multiplying authorizations (without the pool) by two.

The vacancies created by attritions from, as well as by internal movements within, the airborne community result in an increase of total shortages. Shortages are defined as the difference between the authorized inventory level and the on-hand inventory level in each duty position. A negative shortage implies that on-hand inventory is greater than the authorization and represents a surplus for that duty position.

Attritions in the airborne community can result from:

a) personnel leaving the community voluntarily by an expiration of term of service, or involuntarily as a result of punitive or administrative discharge;

b) personnel conducting a permanent change of station out of the airborne community. This is a voluntary reassignment out of the airborne community and, prior to this assignment, the soldier must voluntarily withdraw his qualification of P, V, or S from his official military record.

On-hand inventory levels are recorded by the Army Military Personnel Center (MILPERCEN) as ending inventory levels of the fiscal year (FY). These inventory levels are recorded by MOS, SL, and SQI. Ending inventory levels for a year will be assumed to be the same as the beginning inventory levels for the following year.

7. Funding of Special Training Within the Airborne Community

Soldiers in the airborne community receive hazardous duty pay for being in 'jump status' or training for it. The budget allocated for this purpose consists of two separate accounts: one to be used for training soldiers and the other for paying soldiers already trained and serving in jump status. This thesis will be concerned only with the amount allocated for soldiers in training.

8. Frequency of Training and School Capacity

Airborne training is a three week course. Fifty such classes are cycled throughout the year with each class limited to 400 soldiers. Ranger training is conducted five times per year with each class limited to 200 soldiers and the training period being eight weeks in duration. Special Forces training is conducted twelve times per year with each class limited to 100 soldiers and the training period being twelve weeks in duration.

B. PROBLEM DEFINITION

The purpose of this thesis is the development of a manpower model to predict personnel shortages in all duty positions in the airborne community as determined by Military Occupation Specialty (MOS), Skill Level (SL), and Skill Qualification Indicator (SQI). The objective is to

answer the question: "How many soldiers from each MOS/SL ought to be sent for training for each of the three SQI's P, V and S in order to minimize future shortages of the airborne community and increase its operational readiness?" Obviously any selection for training would result in a decrease of the existing shortage or in the creation of a surplus, either of which is beneficial. However, when the desire to minimize future shortages is combined with the goal of increasing the operational readiness of the airborne community, the need to define the selection criterion more carefully becomes apparent. Chapter two considers how this selection could be done in order to be of use to the airborne community.

1. Forecasting Future Stocks

Manpower planning is matching the supply of people with the jobs available [Ref. 4]. In the airborne community those duty positions that are vacant are the jobs available, and each duty position (e.g. 94B20P-cook skill level 2, parachutist qualified) can be considered as a specific state into which a soldier can be recruited or promoted, and out of which he can be promoted or attrited.

The objective of forecasting is to predict future inventory levels in the airborne community given current stocks, total recruitment into the community, and flows within and out of the community.

2. Optimization of Training Requirements

Once the future inventory levels are predicted for the beginning of a specific fiscal year, shortages in certain job types can also be predicted. The budget with which to train new soldiers and maintain the current force levels sets limits on how many soldiers can enter into special SQI training. Additionally, the capacity of the

school which conducts each type of SQI training constrains the number of soldiers who can enter into that SQI training. The questions to be answered are:

a) how many soldiers from each MOS/SL ought to be sent for training given a restricted budget and school capacity, and

b) what should be the selection criterion: maximum absolute shortage, maximum percentage shortage, or some other criterion?

II. MODEL FORMULATION

The formulation of the model consists of two different submodels which together will forecast future stocks and determine the optimal training policy i.e. how many soldiers are to be sent for SQI training from each MOS/SL combination so that the operational readiness of the airborne community is maximized.

A. FORECASTING MODEL

1. Conservation of Flow

A common characteristic of manpower models is the conservation of flow. Every individual is classified in the system into classes 1 through M, where each of the 31 CMF's, as discussed later in this thesis, is an independent system, and M represents the total number of duty positions within a CMF. Class 0 represents the state outside of the system. Every individual who is present in the system at observation time t, must be in some class at previous observation time (t-1) and also at the subsequent observation time (t+1).

The following equation is the fundamental relation of flow conservation. It equates the number of people in class i at time t to the number of people moving into class i during period (t-1,t) and to the number leaving class i during period (t,t+1).

Let $N_i(t)$ = number of people in class i at time t, and

$f_{ij}(t)$ = the number of people moving from state i to state j during period (t-1,t).

Then

$$\sum_{j=0}^{M} f_{ji}(t) = N_i(t) = \sum_{j=0}^{M} f_{ij}(t+1) , \qquad \text{(eqn 2.1)}$$

for all i=1,2,...,M, and for each t.
Note that the flow f_{ii} from i to i, representing the number of people who stay in class i from time t to time (t+1), must also be included in the sums on each side of equation (2.1).

2. Cross-Sectional Models

The models classified under this term require no knowledge of historical personnel movements prior to time (t-1).

A strong point in favor of such models is that most organizations keep only current files on personnel, although such records may be kept for a number of years. These records make it easy to determine the structure of the organization at the end of each accounting period which may be a month or a year.

3. Fractional-Flow Assumptions

In fractional flow models, [Ref. 9], it is assumed that the fraction of the stock $N_i(t-1)$ in class i at time (t-1) that flows to class j during time period t is a fixed proportion q_{ij} independent of t. The quantity q_{ij} is also referred to as the transition probability from i to j.

Thus the flows at time t can be written as:

$$f_{ij}(t) = q_{ij} \cdot N_i(t-1) \qquad \text{(eqn 2.2)}$$

for all t and for i=1,2,...,M; j=0,1,2,...,M.
For example, let i represent the duty position 11B10P and j the duty position 11B20P, then $f_{ij}(t)$ shows the number of

infantryman with SQI 'P' who were promoted from SL 1 to SL 2 during time period (t-1,t) which corresponds to fiscal year t in this thesis.

Using equations 2.1 and 2.2, stocks for class j=1,2,...,M at time t can be expressed as follows:

$$N_j(t)=\sum_{i=0}^{M} f_{ij}(t)= f_{0j}(t) + \sum_{i=1}^{M} q_{ij} \cdot N_i(t-1) \qquad \text{(eqn 2.3)}$$

where $f_{0j}(t)$ number of soldiers recruited during period (t-1,t) for duty position j.

Let Q be the MxM matrix of q_{ij}'s, known as the transition matrix. Then equation 2.3 in matrix notation becomes:

$$N(t)=[N(t-1)]' \cdot Q + f_0(t). \qquad \text{(eqn 2.4)}$$

Here N(t), and N(t-1), represent column vectors of stocks at times t and t-1, and $f_0(t)$ stands for the column vector of recruitment. The prime symbol means the transpose of the column vector, i.e. a row vector.
Equation 2.4 is the basic fractional flow model and is sometimes called the Markov model [Ref. 10].

Given the stocks at time t-1, the recruitments during period (t-1,t), and the matrix Q, it is possible to predict stocks at time t using equation 2.4.

An assumption required by this model is that each person is subject to only one transition during a single fiscal year. This assumption may be violated in reality as some soldiers may have two transitions in the same year, for example a promotion and an attrition might both occur. The frequency of this occurrence is very small and it is normally prohibited by existing policies. A soldier who is reclassified into a new MOS is normally withheld from promotion consideration, while a soldier who is promoted is restricted from changing his MOS. However, a soldier may be

promoted and attrited from the airborne community within the same fiscal year. This occurrence is largely limited to SL 1 soldiers. Promotions from higher SL's incur an additional time-in-service obligation and preclude attrition during the same fiscal year.

Under the assumption that the distribution of movements from class i to class j is the same each time period (year) the matrix Q can be estimated using data from more than one year [Ref. 12].

4. Hindsight and Foresight Concepts

The terms "hindsight" and "foresight" refer to two variations of the basic fractional flow model described in the previous section.

The difference between the hindsight and foresight models is in the way recruitment is treated. The hindsight model uses a recruitment policy which allows one or more accounting times to pass before a vacancy is filled. This model starts filling vacancies during the period after the period when they were created. The foresight model uses a recruitment policy which attempts to anticipate future vacancies and fill them during the time period that they are created. Thus, the foresight model tries to prevent shortages from taking place.

5. Generation of Transition Matrices

The cross-sectional model as it is represented by equation 2.4 can be used to predict future movements of personnel and end-strength inventories by duty position in the airborne community. For the remainder of this thesis the fiscal year (FY) will be the time period considered.

The Q-matrix is a representation of the interrelationships among MOS's, SL's, and SQI's. When no interrelationships exist between the CMF's, then a separate

transitiocn matrix for each CMF is generated, and the stock vector N can be deccmposed by CMF into smaller force level vectors that correspcnd to each CMF. In the airborne community movements among CMF's are negligible [Ref. 6], hence, a separate Q-matrix can be generated for each CMF.

The first step in generating the transition matrix for a CMF is to extract from a given year's data the internal flows among classes.

Dividing the flow from class i to class j during time period (t-1,t) by the stock in class i at time t-1 we get an estimate of the fraction q_{ij}. Performing this procedure for all i and j = 1,...,M results in the Q-matrix needed for equation 2.4.

Flows from or to state 0 are not considered. Flows from state 0 represent new recruits which for this thesis are dependent on the number of soldiers to be sent to SQI training. These flows are determined by the optimization model. On the other hand, flows to state i=0 represent attritions from the airborne community and are implied by the internal flows during the fiscal year and the stocks at the beginning of the fiscal year.

Since transitions among duty positions are restricted by career progression pattern and promotion policies, the resulting transition matrix has in each row only two or three nonzero elements.

Figure 2.1 represents a transition matrix for CMF 11, where nonzero elements are indicated by x.

B. OPTIMIZATION MODEL

1. The Development of the Objective Function

The first task in the development of an optimization model is to determine its objective or goal. The objective of this optimization model is:

> to minimize the maximum percentage of shortage among all duty positions where there exists shortage. If it is possible to eliminate all shortages, then the goal is to create surpluses proportional to the future shortages that are expected to be created during the coming year.

This goal results in the fulfillment of the objectives which were stated in Section B of Chapter 1. Sending soldiers for training to fill the duty position where the maximum shortage exists or is expected to be created is preventing the creation of structured shortage. Structured shortage refers to the situation in which overstrengths exist for some duty positions and shortages exist for others.

The criterion of percent shortage was selected for the following reasons:

(a) Percentage of shortage is the only indicator of personnel readiness relative to trained personnel availability which is included in the unit status report figure 2.2, section 6c, that is submitted every month and from which is determined the readiness level of a unit. For more details see [Ref. 7].

(b) Percentage of shortage is used as a criterion of evaluation of the status of a unit with respect to readiness in AR 220-1 [Ref. 5]. See also [Ref. 8].

(c) Absolute numbers of shortage in any duty position may be misleading if used for comparison. For example, a shortage

Figure 2.2 Unit Status Report

of 10 people in a duty position where the authorized inventory is 15 has an entirely different meaning than in a case where the number of authorized personnel is 300.

(d) Common sense accepts that an inverse relationship does exist between the percentage of shortage in a unit and its ability to fulfill its goal.

Ideally, it would be desirable to have no shortage at all in any duty position, i.e. to be able to fill any newly created shortage. This would mean that all duty positions would be filled to their authorized levels, and there would exist enough surplus in the pool to cover future shortages. However budget and, in the short term, school capacity constraints do not always allow this goal to be realized. Hence a procedure must be found for determining the number of personnel that ought to be sent for training for each SQI so as to minimize shortage and enhance the operational readiness.

Note that even in the case where there is no shortage it is desirable to keep the percentage of existing surpluses of qualified personnel at a level that ensures effective coverage of future shortages.

The idea behind the solution method to be employed can be described as follows:

(a) calculate the percentage of shortage in each duty position;

(b) select for training a soldier for that duty position where the maximum percentage of shortage exists;

(c) compute the number of shortages after the above selection (using the proper training completion rate) and repeat steps (a) and (b);

(d) continue the above procedure as long as the budget and school capacity constraints permit.

Figure 2.3 shows a graphical representation of the objective function.

As can be seen from Figure 2.3 the objective function is not a continuous function and the usual optimization methods of linear or nonlinear programming become inappropriate. Therefore, the objective function was optimized by using marginal analysis, having as a goal the minimization of the maximum percentage of shortage.

The method of marginal analysis is based on the return that is obtained from the consumption of one unit of resource. For the purpose of this thesis the marginal return of sending one more person for training to cover shortage in some duty position is the reduction in the existing percentage of shortage in that duty position due to this decision.

It is crucial to decide whether existing shortage or predicted shortage is to be used, since these alternatives lead to different results. Using existing shortage has the characteristic of working with a known quantity. On the other hand, using predicted shortage to guide the training decisions is also appealing. The facts that the training period is quite short (three, eight, or twelve weeks) and that a shortage in jump status usually exists in a small number of duty positions and can be covered quickly by sending soldiers for training early in the fiscal year lead to the conclusion that it is more advantageous to first

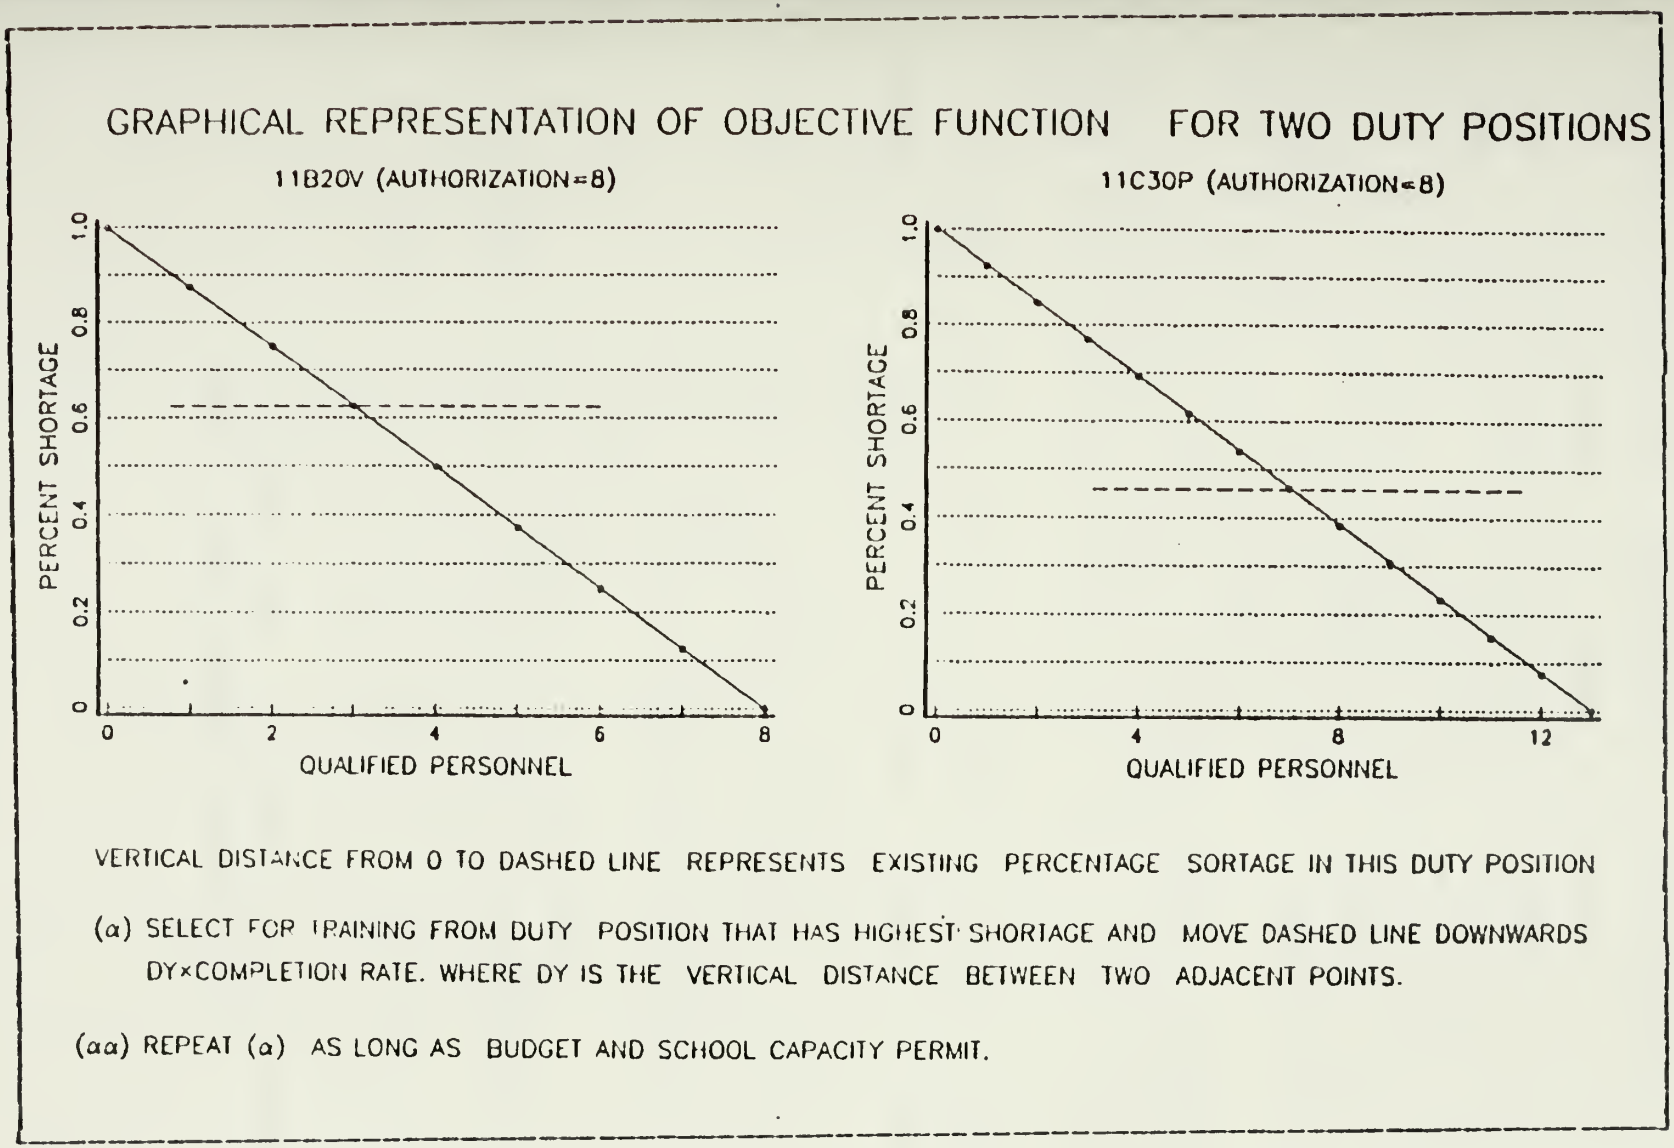

Figure 2.3 Graphical Representation of Objective Function

consider filling existing shortages. Then predicted shortages must be used to guide further training decisions which will create surpluses to cover shortages that otherwise would be created during the coming fiscal year. So in a case where two duty positions have the same authorizations and no current shortages, more soldiers will be sent for training for the duty position which has a larger loss rate (due to attrition, promotion and perhaps other causes), since it is expected that by the end of the fiscal year more shortages will exist in that duty position.

For the purpose of planning training requirements using the hindsight concept, the vector of predicted shortages in the airborne community for time t can be expressed as:

$$S(t) = A(t) - [N(t) + b \cdot U(t)] - b \cdot X(t) \quad \text{(eqn 2.5)}$$

where $A(t)$ = vector of authorized personnel levels at time t;

$N(t)$ = vector of current force levels that result after transitions of existing personnel at time period $(t-1,t)$, as generated by the Markov process described in the section A.5 of Chapter II;

b = the completion of training rate;

$U(t)$ = vector indicating number of personnel undergoing SQI training at time t; and

$X(t)$ = vector showing number of recruits to be entered for SQI training during time period $(t,t+1)$.

The symbol $X(t)$ represents the decision variable in this problem formulation.

In the same way expected shortage at time t+1 can be expressed when using the foresight concept as:

$$S(t+1) = A(t+1) - [N(t) + b \bullet U(t)] \bullet Q - b \bullet X(t) \quad \text{(eqn 2.6)}$$

where Q is the transition matrix described in section A.5 of this chapter.

This shortage is actually the difference between authorization and the sum of expected legacy after one year and the new graduates due to current training policy. The term legacy stands for forecasted inventories without new recruits. For more details see [Ref. 11].

It is assumed that there is no attrition for new graduates during the fiscal year they graduate, and no transitions to other duty positions.

For each duty position, these two relationships can be expressed as:

$$S_{ijk} = A_{ijk} - [N_{ijk} + b_k \bullet U_{ijk}] - b_k \bullet X_{ijk} \quad \text{(eqn 2.7)}$$

where i denotes the specific MOS,
j denotes the grade/skill level, and
k denotes the specific SQI.

For simplicity the time argument was omitted. The time argument for current or future shortage is the same as in equations 2.5 and 2.6 respectively.

The percentage of shortage for each duty position is defined as the quotient of S_{ijk} over A_{ijk}.

The symbol $X_{ijk}(t)$ denotes the decision variable chosen for this optimization model and represents the number of personnel with MOS i and SL j that should enter into SQI k training during time period (t,t+1). The interpretation of $b_k \bullet X_{ijk}$ is the number of qualified soldiers who will

graduate from SQI k training and enter into the airborne community occupying an MOS i and skill level j duty position.

For simplicity, the term $b_k \cdot U_{ijk}$ will be assumed to be included in the inventory N_{ijk}. This represents the number of future graduates from among soldiers currently being trained at school. This number can be estimated (using the proper completion rate) from given data and be counted in the current inventory since it does not depend on the training policy decisions for the upcoming fiscal year.

As discussed in the previous chapter, the authorized inventory levels are provided by the PERSACS document. The course completion rate of each type of SQI training is provided from empirical data. Force levels are provided by historical data for the initial time and are generated by the Markov process for succeeding times.

Thus, since the objective is to minimize the maximum percentage shortage among all duty positions as specified by MOS i, SI j, and SQI k, the objective of the problem can be mathematically expressed as:

$$\text{Minimize } [\text{Maximum}_{i,j,k} \ (S_{ijk} / A_{ijk})].$$

2. The Development of the Constraints

a. School Capacity Constraint

The total number of soldiers who enter SQI training cannot exceed the capacity L of the school during the corresponding time period (selected to be the fiscal year).

Mathematically, the school capacity constraint can be expressed as:

$$\sum_i \sum_j X_{ijk} \leq L_k \qquad \text{for each } k$$

where L_k represents the capacity of the school for the k-th SQI training, during a fiscal year.
For example, if 1000 soldiers can be accommodated in ranger training throughout the year by the United States Army Ranger School, then the total number of soldiers of all MOS's and skill/grade levels that can enter into that type of SQI training is limited to 1000. This limitation can be the result of living accommodations or any other factor which sets a physical restriction on the number of students that can be effectively trained.

b. Budget Constraint

The second factor that puts bounds on the decision variable is the budget level B which is allocated for SQI training in the airborne community.

A soldier is paid an additional amount of $83 per month while he is in training for any SQI. There are a few exceptions. For example, if a soldier is hospitalized for a long time period he does not receive this pay. If a soldier fails to complete the entire course of P training, he receives no payment. If a soldier fails to complete the entire course of V or S training, he is paid an amount proportional to the length of training completed. If times of failure are assumed to be uniformly distributed over the training period, the average time of failure is the midpoint

of the training period, and the cost is half the cost of training a soldier for the entire training period. Actual data indicate the average percent course completion to be approximately 0.17 instead of 0.50 before failure occurs. Thus the cost incurred is 0.17 times the total cost of the course for each individual who fails.

Mathematically, the budget constraint can be expressed as:

$$83 \cdot \sum_i \sum_j \left[\sum_k d_k \cdot b_k \cdot X_{ijk} + \sum_{k=2}^{3} d_k \cdot 0.17 \cdot (1-b_k) \cdot X_{ijk} \right] \leq B \qquad (2.8)$$

where

k = 2, 3 correspond to V and S respectively;

B = the budget which is allocated for SQI training;

d_k = the duration of the training period in months for SQI k; and

b_k = completion rate of training in SQI k.

The left hand side of inequality (2.8) represents the training cost for soldiers who either completed training or failed during the training period.

3. The Optimization Model

The mathematical representation of the optimization problem is:

$$\underset{X_{ijk}}{\text{minimize}} \left[\underset{i,j,k}{\text{maximum}} \left((A_{ijk} - N_{ijk} - b(k) \cdot X_{ijk}) / A_{ijk} \right) \right] \quad (2.9)$$

subject to:

$$\sum_i \sum_j X_{ijk} \leq L_k \qquad \text{for } k=1,2,3.$$

$$83 \cdot \sum_i \sum_j \left[\sum_k d_k \cdot b_k \cdot X_{ijk} + \sum_{k=2}^{3} d_k \cdot 0.17 \cdot (1-b_k) \cdot X_{ijk} \right] \leq B$$

$$X_{ijk} \geq 0.$$

Here the first constraint represents the school capacity restriction, the second is the budget restriction, and the third is the nonnegativity restriction of the decision variables.

C. MIXED MODEL

The forecasting and optimization models linked together form the mixed model.

Implementation of the mixed model begins by creating from historical data the transition matrices for each CMF using promotions within the airborne community and attritions out of the airborne community. Furthermore, vectors of authorized and qualified personnel must be extracted from tables of authorizations and inventories for each CMF.

Once the above data have been obtained, the forecasting model is used to predict legacies for the end of the fiscal

year. That is, inventories are forecast without new recruits. Then shortages for the beginning and end of the fiscal year under consideration are calculated. These shortages are calculated by subtracting inventories from authorizations. Finally the optimization model is used to determine the recruitment vector (training entrants times completion of training rate), which is used to generate the total inventory vector (sum of legacy and recruitment) for the beginning of the next fiscal year.

The above process is repeated for each fiscal year for which training requirements are desired.

III. EXECUTION OF THE MODEL

In this chapter the data required to create the input for the optimization and forecasting models, the methodology used in calculating the required parameters, as well as, the results of the mixed model will be discussed.

A. DISCUSSION OF DATA

The following data are required for the use of the model:

(a) available training budget,

(b) school capacity for each SQI,

(c) rate of completion of training for each SQI,

(d) cost of training one soldier for each SQI.

Also required for each CMF are the following vectors:

(a) the names of the duty positions included in the CMF, e.g. 11E10P,11B20P,11B30P,...,11C40V.

(b) authorizations for the beginning of each fiscal year for which training requirements are desired and for the beginning of the next fiscal year,

(c) inventories at the beginning of the first fiscal year for which training requirements are desired.

For each CMF these vectors must have the same length and the elements must be in the same order as those of the vector of names of duty positions in item (a) above. For consistency, for each CMF the first elements in each vector correspond to duty positions of SQI P followed by duty positions of SQI V. There is no SQI S in any CMF except CMF 18.

Finally for each CMF a transition matrix must be constructed with rows and columns also corresponding to the vector of names of duty positions.

1. Evaluation of Required Parameters

a. Budget

As discussed in Chapter II there is a specific budget that is allocated to the airborne community for hazardous duty pay for every soldier undergoing SQI training. In FY83, FY84, and FY85 the size of this training budget was 721, 1042, and 1042 man-years respectively. An enlisted airborne soldier currently receives $83 per month in jump pay. At this rate of pay, one man-year represents $996. There exists a separate budget called the operating budget which is allocated to the airborne community for hazardous duty pay of soldiers serving in the airborne community. This budget does not affect the optimization model since there is no connection between this budget and the training budget.

b. School Capacity

The school capacity for FY 1983 was:

SQI P: 20000 (50 classes, 400 soldiers per class)

SQI V: 1000 (5 classes, 200 soldiers per class)

SQI S: 1200 (12 classes, 100 soldiers per class)

For the purpose of the model it is assumed that the same school capacity is valid for FY's subsequent to FY83 as well.

c. Completion Rate

The course completion rate for each SQI is calculated by dividing the total number of graduates by the number of soldiers who had originally entered training for that SQI. These rates for FY83 were calculated by the Army Training Requirements and Resource System (see [Ref. 14].) and found to be:

0.81 for parachutists (P),

0.64 for rangers (V), and

0.55 for specialists (S).

These rates were recomputed for SQI's P, V, and S, using data received from the airborne community for FY82 and FY83 classes, and were found to be 0.79, 0.68, and 0.43, respectively. These recomputed rates are used in the remainder of this thesis.

d. Cost of Training

The training cost is the amount required to train a soldier as P, V, or S. This amount depends on the length of the training period since a trainee is paid hazardous duty pay during training. This cost also depends on the completion rate since only people who graduate receive full payments as discussed in section B.2.b of Chapter II. Therefore the cost was calculated as follows:

for parachutists : $83 \cdot 0.79 \cdot 9/13 = \$45$

for rangers : $83 \cdot [0.68+0.17 \cdot (1-0.68)] \cdot 24/13 = \$113$

for specialists : $83 \cdot [0.43+0.17 \cdot (1-0.43)] \cdot 36/13 = \$121.$

where 83 = monthly payment in dollars of a soldier undergoing SQI training

0.17 = percent course completion of soldiers who fail

0.79 = completion rate for SQI P training

0.68 = completion rate for SQI V training

0.43 = completion rate for SQI S training

and

9/13 = duration of training in months for SQI P

24/13 = duration of training in months for SQI V and

36/13 = duration of training in months for SQI S.

Here one week = 12/52 = 3/13 months was used.

For budget allocation purposes one could include in the cost of V and S training the cost of first training the soldiers as parachutists. The validity of this depends

on the fraction of V and S recruits who have already attended P training. Since this fraction is unknown, this cost is not included in the cost of V and S training for this thesis.

2. Creation of Required Vectors

To create the required vectors, authorizations for FY84, FY85, and FY86, and inventories for the beginning of FY84 were used. These data were received from MILPERCEN. For CMF 18 which was newly created during 1983 it was assumed that authorizations and inventories for each duty position equaled the summation of corresponding numbers for the duty positions from which each position was composed. For example, according to the information paper received from MILPERCEN [Ref. 13], soldiers from 11B30S and 12B30S could transfer to duty position 18B30S. Therefore, authorizations and inventories for duty position 18B30S were obtained as the sum of authorizations and inventories respectively for duty positions 11B30S and 12B30S. The inventories so created for CMF 18 are probably higher than the actual ones, since transfer to the new CMF was voluntary. Because of unavailability of actual data, the numbers used were estimates.

The vectors of duty positions are needed for easy interpretation of the final output. These vectors were created using all the duty positions that appear in the authorization or inventory tables and belong to the career progression pattern of a CMF. The first positions of these vectors always correspond to parachutists, the next to rangers and the last to specialists. Furthermore, for consistency, the duty positions were arranged within each SQI in alphabetical order according to their MOS designation and in increasing order of skill level (e.g. in CMF 11, 11C10P is before 11C20P and after 11B50P). The duty position

00Z50 tc which soldiers with SL5 from all CMF's may be promoted is not considered in this thesis, due to the unavailability of data on promotions to this duty position. Furthermore, such a model would become very complicated since there would be a connection among all CMF's and the transition matrices would no longer be independent of each other. In that case it would be necessary to create one enormous matrix for the airborne community. The simplification of not considering the training requirements for the MOS/SI combination 00Z50 actually does not significantly affect the solution of the training problem. This is true since C0Z50 is the last grade in the hierarchy and there always exist trained personnel of SL 5 in some CMF to cover vacancies without the need for training.

After the creation of the vector of duty positions for each CMF, the corresponding vectors of authorizations and inventories were extracted from the tables of authorizations and inventories. Inventories include soldiers that are being trained currently, at the time of planning. For illustration, the names of duty positions, authorizations and inventories for CMF 11 are presented in Table 2. Appendix B contains all such Tables for all CMF's.

The inventories such as those shown in Table 2 were obtained by adding the number of trained personnel that serve in the 82nd airborne division, and the number of qualified soldiers who serve in other units or exist in the pool. These data were obtained from MILPERCEN. The soldiers undergoing SQI training at the beginning of FY 1984 were not available and were not included in the inventories.

3. Creation of Transition Matrices

Flow data (promotions, attritions, and other transitions among duty positions) for FY83 as well as inventories for the beginning of FY83 were obtained from the

TABLE 2

Authorizations and Inventories for CMF 11

SL1	SL2:	2493	46	120
SL2	SL3:	1105	103	201
SL3	SL4:	576	54	157
SL4	SL5:	261	40	101

Table 7 shows by SL the number of soldiers who changed their SQI qualification during FY 1983 with or without a promotion to the next higher SL. Changes from or to S are not considered because such changes are not possible after FY83.

Table 8 shows by SL inventories of P and V in FY83 from which transitions to V and P, respectively, can occur. For example, MOS 11H is not encountered with SQI V, so duty positions belonging to MOS 11H were not included in the inventory under P in Table 8 . The inventories in Table 8 are needed in the computation of transition rates from P to V and vice-versa.

SL3:	434	39	16
SL4:	280	20	26
SL5:	95	12	23

Table 9 shows the promction rates from one SL to the next higher one. These rates are the quotients of the numbers in Table 4 and the corresponding inventories shcwn in Table 3 .

It was assumed that promotion rates from one SL to the next higher one were the same for all MOS's within each SQI. However promotion rates were calculated separately for P, V, and S due to the fact that graduates of different SQI training have different lengths of service in their pay grade, consequently their rates of promotion differ significantly.

SL5:	613	138

Transitions among SQI's involving a change in MOS with or without a change in CMF were negligible (29 soldiers in total) and were not included in the forecasting model. The only remaining possible transitions are from P to V and visa-versa. Any transition from or to S since FY1984 would imply a change in CMF and is no longer possible. Also changes between P and V are possible only in some CMF's. The inventories by SL where such transitions may occur are shown

TABLE 9

Promotion Rates from one SL to the next by SQI/SL

SL4	SL5:	.108	.159	.124
SL5	00Z50:	.072	.072	.072

Note: There was no available data on promotions from SL5 to 00Z50. Rates in the last row were taken from Army-wide promotion rates for FY83 15

in Table 8. Inventories of V's are equal to the total number of V's since any V can change to a P.

The transition rates from P to V and from V to P with or without promotion were calculated by dividing the flows of soldiers from one SQI to the other (from Table 7) by the corresponding inventories of duty positions in which these transitions originate (quantities in Table 8). Table 10 shows these rates.

Attrition rates for each SQI/SL combination were calculated as the quotient of the sum of the quantities in Tables 5 and 6 over the quantities in Table 3. These rates are shown in Table 11.

Staying rates (that is, proportion of soldiers who make no transition during the FY) for each SQI/SL combination were calculated by subtracting from 1.0 the sum of the promotion rate, attrition rate, and other transition rates to other duty positions. Table 12 shows the proportion of people who stay in the same SL for each SQI, for duty positions where there are no transitions to a different SQI. For example, since soldiers in duty position 11H30P cannot

change to SQI V, the staying rate in this duty position (from Table 12) is .697 .

Table 13 shows the staying rates in those duty positions for which transitions to different SQI's are possible. For example, since soldiers in duty position 11B20P can change to SQI V, the staying rate in this duty position (from Table 13) is .516 .

Tables 12 and 13 show the same staying rates for S. This is due to the fact that no MOS occurs both in CMF 18 and in another CMF.

Figure 3.1 Transition Matrix for CMF 12

from this duty position to duty position 12B20P is 0.171. Appendix C contains all the transition matrices for all CMF's. Due to large size of CMF's 63, 71, and 91 instead of the entire transition matrices only the nonzero elements are shown (Figures C.16, C.19, and C.25).

B. DISCUSSION OF RESULTS OF THE MIXED MODEL

The model was implemented on the IBM 3033 machine at the Naval Postgraduate School using the programming language APL. Execution of the model is started by typing the word "AIRBORNE". The program interactively asks for values of the parameters and for input of the required data. An example of a terminal session is shown in appendix D. The function[1] "AIRBORNE" is a driver program which invokes the forecasting and optimization subroutines (FORCAST, ARIS, GROUP, SCHOOL) and prints the results by fiscal year and CMF. The functions "ARIS" and "GROUP" implement the optimization model. The program for the forecasting model consists of the function "FORCAST". The function "SCHOOL" produces the required school capacity and budget in order to achieve a specific percentage coverage of authorizations. The functions "DATA" and "VALUE" are also invoked by the "AIRBORNE" program and help in the entry of required data in the model. The function "MATRIX", invoked by the user, constructs the required transition matrices. The function "DATAINPUT" also invoked by the user is a driver program which invokes the functions "DAT1" and "DAT2" and can be used for the creation of required vectors of data. Finally, the function "DATAMAN" also invoked by the user can be used for manipulation (adding elements, deleting elements, reassigning values to an element) of existing

---

[1]In APL the word "function" means a program performing a specific task.

vectors of data. All the above programs are listed in Appendix E.

Appendix D contains a description of the model, as well as the output from a run of the model. After user input, the results by fiscal year follow. First, a summary of results is printed showing the remaining budget and school capacity as well as the maximum percentage shortage for each SQI. These values could help the user in deciding on a training policy. For example, shortages of 0.1744 and -0.516 for specialists (S) and parachutists (P), respectively, mean that there is at least one duty position in specialists for which the remaining shortage after training will be 17.44% of authorization, and that there is at least one duty position in parachutists for which the surplus will be 51.6% of authorization. All the other S and P duty positions have smaller percent shortages and larger percent surpluses respectively. Therefore, the school capacity is insufficient for specialists and larger than needed for parachutists. After the summary, detailed results follow by CMF.

For each CMF a table of results is produced whose number of rows equals the number of duty positions in the CMF, and the number of columns equals seven. The first column contains the names of the duty positions. The next two columns contain the authorizations for the beginning and end of the fiscal year under consideration. The fourth and fifth columns indicate the net requirements (i.e. shortages) for the beginning and end of the fiscal year needed to cover authorizations up to 100%. The sixth column is the value of the decision variable showing the number of soldiers who should enter training. The seventh column is the recruitment that is expected for each duty position using the training policy of column six (i.e. column seven equals completion rate times column six).

At the beginning of the session the user is asked to enter the number of fiscal years (1 or 2) for which results are desired. Depending on this answer the user has the following options:

(a) In case of entering 1:

(i) to run the program for succeding fiscal years keeping authorizations constant;

(ii) to rerun the program for the same fiscal year using different parameters, e.g. larger completion rates.

(b) In case of entering 2 he has only the option to rerun the program for these 2 fiscal years using different parameters, e.g. different budget or school capacity.

Running the program for two fiscal years requires authorizations for the beginning of the first and second fiscal years as well as for the end of the second fiscal year.

Examining the output (Appendix D) that refers to CMF 11 one observes a large allocation of 4269 positions from the school capacity for P for the duty position 11B10P. This drives its expected shortage from 27% to a surplus of 51.6%. For the duty position 11C20P 13 soldiers were first sent for training to cover existing shortage in the beginning of the fiscal year and then, after covering all existing shortages, the model started covering predicted shortages at the end of FY 84 to finally drive all the predicted shortages to 0 and furthermore to create surpluses of at least 51.6% of authorizations for each duty position with SQI P. The user can cause the model to ignore current shortage and deal only with future shortage by equating authorizations of the first year to inventories. In that case the model will not find any existing shortage and will start covering expected future shortages immediately.

C. ANALYSIS OF REQUIRED PARAMETERS

1. Budget

The available budget for training is a critical item in the optimization model as it is one of the constraints that prevents the model from recruiting an unlimited number of personnel.

A small budget, which does not permit the school capacity to be fully used, results in a decrease of training allocations to the SQI in which the corresponding duty positions have lower percent shortages. For example, if the maximum percent shortage in P's is 0.50 and in V's is 0.20, and to bring the shortage in P's to the level of V's requires the use of the whole budget that implies that no one would be sent for V training.

2. School Capacity

The school capacity is the only factor that causes the model to lead to unequal maximum percent shortages for P, V, and S. This can happen in a case where school capacity for one SQI has been exhausted while there still exists available budget for training. This occurs when the school capacities for the three SQI's are not proportional to the existing or expected shortages in the respective duty positions and can lead to the creation of structured shortage which is an undesirable situation.

3. Cost of Training

The cost of training one soldier in any SQI is related to the length of training period and inversely related to the completion rates. Increase in training costs results in decrease of the decision variable vector (i.e. the bigger the cost of training the less the number of people who can be trained under a fixed budget). Increase

in training costs can also affect the allocation among SQI's through the budget constraint as discussed previously.

4. Course Completion Rate

A decrease in the cource completion rate for some SQI results in bigger allocations to that SQI training.

A change in the completion rate can also affect the decision variable through the constraints. For example, as the completion rate in V decreases, the training becomes more expensive and bigger allocations to V training are required to get a specific number of V graduates.

D. CHANGE OF POLICY ANALYSIS

A change of policy implies changes in one of the following parameters:

(1) Promotion rate;

(2) attrition rate; or

(3) transition rates among SQI's.

Therefore, a change of policy implies changes in the transition matrices and as a result changes in the predicted inventories.

Change in the promotion rate can apply to a specific SQI and/or SL. For example, the promotion rate for parachutists with skill level 2 may be changed to insure that parachutists with SL 2 are promoted at a rate 0.30 instead of the previous 0.215. Assuming that attrition rates and transition rates among SQI's remain the same the staying rate for SQI P and SL 2 personnel is changed from 0.516 to 0.431 for the case when transitions from P to V are possible and changed to 0.446 when transitions from P to V cannot occur.

Changes to the attrition rate or other transition rates would create similar changes in the staying rates.

To allow such changes in the forecasting model the transition matrices have to be changed. This is effected by creating new transition matrices after making the correction in transition rates inside the function "MATRIX" which requires knowledge of the APL programming language.

IV. SUMMARY AND FUTURE CONSIDERATIONS

A. SUMMARY

This thesis formulates a model which forecasts future force levels and determines the number of soldiers to be sent for training within the airborne community. The goal of the optimization model is the minimization of the maximum percentage shortage of personnel relative to authorization. The formulated model consists of two submodels. The first submodel is a forecasting model in which future inventories are estimated using Markov chain theory while the second submodel is an optimization model which employs the strategy of marginal analysis. The model formulated and discussed in this thesis can successfully handle trends in shifting manpower demands. Also, this model is a planning aid for manpower decision-makers in answering "what if" questions relative to changes in budget, school capacity, cost of training, and training school completion rates, attrition and promotion rates.

In summary, the user's work consists of the following three steps:

(i) Creation of required vectors of names of duty positions, authorizations, and inventories. This can be done by typing the word "DATAINPUT", which is an interactive program that facilitates the creation of these vectors.

(ii) Construction of transition matrices. For CMF 11 the user should type "M11←MATRIX P011", where P011 is the vector of names of duty positions and M11 is the name of the newly created transition matrix for CMF 11.

(iii) Run the forecasting and optimization models by typing the word "AIRBORNE".

(iv) Changes in the data may be made if necessary using the function "DATAMAN". For example, to change the vector of names of duty positions for CMF 12 the user should type "P012←DATAMAN".

B. FUTURE CONSIDERATIONS

Large data requirements can be considered as a disadvantage in the use of the model. Derivation of the required data in proper format using a computer program to extract vectors of authorizations, inventories, and names of duty positions from existing computer files of authorizations and inventories would result in a big reduction of the user's work.

Potential areas which remain to be investigated are:

(i) computerized data derivation: that is, creation of a computer program to extract vectors of names, authorizations and inventories from existing files of authorizations and inventories for each CMF,

(ii) validation of the model: empirical data of a fiscal year (other than FY83 on which the construction of the model is based) should be used to determine its effectiveness in personnel prediction and optimization.

(iii) data verification: The fraction of V and S recruits who currently hold the P qualification should be determined so that the proper changes can be made in the training cost computation. This fraction also has an effect on completion rates and utilization of school capacity.

APPENDIX D

SAMPLE TERMINAL SESSIONS

```
      1. DESCRIBE.

THIS WORKSPACE CONTAINS THE NECESSARY  PROGRAMS FOR  PREDICTION OF
TRAINING REQUIREMENTS IN THE AIRBORNE COMMUNITY, IT WAS WRITTEN BY
CAPTAIN D. T. KOUTIANOUDIS IN PARTIAL  FULFILLMENT  OF THE  DEGREE
OF MASTER OF SCIENCE IN OPERATIONS RESEARCH.

   THE MODEL REQUIRES THE DATA TO BE STORED UNDER THE NAMES:
     'PO,,'  FOR NAMES OF DUTY POSITIONS IN CMF ,, ;
     'INV,,' FOR INVENTORIES OF CMF ,, ;
     'M,,'   FOR THE TRANSITION MATRIX FOR CMF ,, ;
     'A,,1'  FOR FIRST YEAR(CURRENT) AUTHORIZATIONS OF CMF ,, ;
     'A,,2'  FOR SECOND YEAR AUTHORIZATIONS OF CMF ,, ;
     'A,,3'  FOR THIRD YEAR AUTHORIZATIONS OF CMF ,, ;
WHERE ',,' IS THE NUMBER OF THE CMF.
TO SEE  ANY OF  THE ABOVE THE USER MAY TYPE ITS NAME; FOR EXAMPLE,
TO SEE CURRENT YEAR AUTHORIZATIONS OF CMF 12 TYPE 'A121'.

    TO DERIVE RESULTS FOR A YEAR ONE SHOULD FOLLOW THE STEPS:
     (1)CREATE VECTORS  OF DATA USING  THE  FUNCTION  'DATAINPUT';
        JUST TYPE 'DATAINPUT'TO CREATE VECTORS FOR ALL CMF WANTED;
        OR UPDATE(ADD A NEW ELEMENT, DELETE AN  EXISTING  ELEMENT,
        CHANGE THE VALUE OF AN ELEMENT) AN EXISTING VECTOR OF DATA
        USING  THE FUNCTION 'DATAMAN';  FOR EXAMPLE, TO UPDATE THE
        VECTOR OF DUTY POSITIONS FOR CMF 12 TYPE 'PO12←DATAMAN';
     (2)CREATE  TRANSITION  MATRICES USING  THE FUNCTION 'MATRIX';
        FOR EXAMPLE, FOR CMF 12 ENTER 'M12←MATRIX PO12';
     (3)RUN THE MODEL BY TYPING THE WORD 'AIRBORNE'.

NOTE: (I) AUTHORIZATIONS  ARE INITIALLY ENTERED FOR YEARS 1, 2, 3.
      AT THE END OF YEAR 1, THE CURRENT YEAR IS YEAR 2. WHEN ASKED
      (WHILE  WORKING  IN  THE  FUNCTION 'DATAINPUT') FOR  CURRENT
      AUTHORIZATIONS, YOU MAY TYPE A,,2. LIKEWISE,  AUTHORIZATION
      FOR THE NEXT YEAR CAN BE UPDATED BY TYPING A,,3.
      (II) ALL  DATA ARE STORED IN COLUMN VECTORS, IF YOU  WANT TO
      SEE THEM IN A ROW, TYPE A COMMA  BEFORE  THE NAME;  E.G. FOR
      INVENTORIES OF CMF 31 TYPE ',INV31'.
      (III) ADDITIONS OR DELETIONS MUST BE MADE IN ALL VECTORS  OF
      A CMF SO THAT  THEIR LENGTHS  ARE  IDENTICAL.
      (IV) IF  YOU CREATE A NEW VECTOR OF DUTY POSITIONS, CHECK IT
      TO BE SURE THAT DUTY POSITIONS ARE ARRANGED IN  ALPHANUMERIC
      ORDER OF MOS, INCREASING ORDER OF SL AND P,V,S ORDER OF SQI.
      (V) AFTER  CREATION  OF  DATA  OR  ANY  CHANGE  BE  SURE  TO
      SAVE YOUR WORK BY TYPING ')SAVE', IF THIS  CHANGE  IS  MEANT
      TO BE PERMANENT.
```

2. Sample Terminal Session of the APL Function "DATAINPUT".

```
      DATAINPUT
THIS FUNCTION IS USED TO CREATE VECTORS OF DUTY POSITIONS,
AUTHORIZATIONS, AND INVENTORIES.

ENTER THE FY (2 DIGITS) FOR WHICH INVENTORIES ARE AVAILABLE:
⎕:
      .84
ENTER CMF NUMBER FOR WHICH YOU WANT TO ENTER DATA; ONE OF
THE FOLLOWING:
11 12 13 16 18 19 23 27 28 29 31 33 51 54 55 63 64 67 71 74 76 79 81
 84 91 92 94 95 96 97 98
⎕:
      .28
ENTER 'PO' TO ENTER DUTY POSITIONS
      'A1' TO ENTER AUTHORIZATIONS OF BEGINNING FY84
      'A2' TO ENTER AUTHORIZATIONS OF BEGINNING FY85
      'A3' TO ENTER AUTHORIZATIONS OF BEGINNING FY86
      'IN' TO ENTER INVENTORIES OF BEGINNING FY84
 :
.PO
THE SEQUENCE OF NAMES OF DUTY POSITIONS SEPARATED BY A BLANK SPACE
MUST BE ENTERED IN QUOTES, FOR EXAMPLE,'11B10P 11B20P ... 11C40V';
IF NAMES DO NOT FIT IN ONE LINE TO CONTINUE IN NEXT LINE TYPE(AFTER
THE LAST NAME) A SPACE FOLLOWED BY ',⎕  BEFORE PRESSING ENTER.

ENTER NAMES OF DUTY POSITIONS (INSIDE QUOTES) FOR CMF 28
⎕:
      .'28F10P 28F20P 28F30P 28F40P 28K20P 28K40P'
DO YOU WANT TO ENTER MORE DATA? ENTER Y OR N
.Y
ENTER CMF NUMBER FOR WHICH YOU WANT TO ENTER DATA; ONE OF
THE FOLLOWING:
11 12 13 16 18 19 23 27 28 29 31 33 51 54 55 63 64 67 71 74 76 79 81
84 91 92 94 95 96 97 98
⎕:
      .28
ENTER 'PO' TO ENTER DUTY POSITIONS
      'A1' TO ENTER AUTHORIZATIONS OF BEGINNING FY84
      'A2' TO ENTER AUTHORIZATIONS OF BEGINNING FY85
      'A3' TO ENTER AUTHORIZATIONS OF BEGINNING FY86
      'IN' TO ENTER INVENTORIES OF BEGINNING FY84
 :
.IN
THE SEQUENCE OF DATA NUMBERS MUST BE SEPARATED BY  A BLANK  SPACE
OR COMMA, IF DATA DO NOT FIT IN ONE LINE TO CONTINUE IN NEXT LINE
TYPE ,⎕ BEFORE PRESSING ENTER.

ENTER INVENTORIES FOR FY84 AND CMF 28
⎕:
      .43 267 12 67 76 198
DO YOU WANT TO ENTER MORE DATA? ENTER Y OR N
.N
```

3. Sample Terminal Session of the APL Function "DATAMAN".

```
      ,PO28
28F10P 28F20P 28F30P 28F40P 28K20P 28K40P
      PO28←DATAMAN
THIS FUNCTION DOES THE FOLLOWING:
ADDITION OF AN ELEMENT, DELETION OF AN ELEMENT, AND REPLACEMENT OF
THE VALUE OF AN ELEMENT IN AN EXISTING VECTOR OF DATA.

ENTER THE NAME OF VECTOR YOU WANT TO CHANGE
□:
      ,PO28
ENTER A, D, OR R TO ADD A NEW ELEMENT, DELETE AN EXISTING
ELEMENT, OR REPLACE THE VALUE OF AN ELEMENT RESPECTIVELY:
,A
ENTER LINE NUMBER AFTER WHICH YOU WANT TO ADD A LINE
□:

4. Sample Terminal Session of the APL Function "MATRIX".

```
      M11←MATRIX PO11
THIS FUNCTION PRODUCES TRANSITION MATRICES, TO GET CORRECT RESULTS
ELEMENTS  OF THE  ARGUMENT (VECTOR  OF DUTY  POSITIONS) MUST BE IN
ALPHANUMERIC  ORDER OF MOS, INCREASING ORDER OF SL AND P,V,S ORDER
OF SQI.

ARE THERE ANY CHANGES IN MOS DUE TO PROMOTIONS IN THIS CMF?
ENTER Y OR N
.Y
ENTER MOS/SL FROM WHICH THE PROMOTION ORIGINATES(E.G.11H40);
IF YOU ARE FINISHED ENTER F:

5. Sample Terminal Session of the APL Function "AIRBORNE".

```
      AIRBORNE
IN ORDER TO USE THE MODEL YOU  NEED THE FOLLOWING INPUT:
(1) VECTORS OF NAMES OF DUTY POSITIONS FOR EACH CMF  STORED UNDER THE
    NAME 'PO,,', WHERE ',,' IS THE  CMF NUMBER, THE INDIVIDUAL DUTY
    POSITIONS  ARE ARRANGED IN  ALPHANUMERIC ORDER OF MOS, INCREASING
    ORDER OF SL, AND P,V,S ORDER OF SQI,
(2) VECTORS OF AUTHORIZATIONS  FOR  TWO  OR  THREE FISCAL  YEARS  AND
    VECTORS OF INVENTORIES FOR THE FIRST  FISCAL  YEAR FOR  EACH  CMF
    CORRESPONDING TO THE DUTY POSITIONS GIVEN ABOVE, THESE ARE STORED
    UNDER THE NAMES: A,,1, A,,2, A,,3 AND INV,, EACH OF WHICH  CAN BE
    CREATED  USING  THE  FUNCTION 'DATAINPUT', OR UPDATED  USING  THE
    FUNCTION 'DATAMAN',
(3) A TRANSITION MATRIX FOR EACH CMF,THIS MATRIX CAN BE CREATED USING
    THE FUNCTION 'MATRIX'; E,G, FOR CMF 11 TYPE:'M11←MATRIX PO11'

DO YOU WANT TO ENTER DATA?  ENTER Y OR N
.Y
INPUT DESIRED NUMBER OF FY'S FOR WHICH YOU WANT
TRAINING REQUIREMENTS (1 OR 2).
□:
      .2
IDENTIFY CMF'S YOU WANT TO WORK WITH (E,G, 11 13 ETC,)
TYPING 'ALL' WILL PROVIDE CMF'S:11 12 13 16 18 19 23 27 28 29 31 33
